

MYCETES ARGENTINENSES

AUCTORE

CAROLO SPEGAZZINI

(SERIES I)

4. LEPIOTA OCHROLEUCA Speg., n. sp.

Diag. *Clypeolaria, caespitosa, pileo e campanulato expanso, grosse obscureque umbonato, ex ochroleuco flavescente, dense minuteque granuloso-squarruloso, non striato, lamellis pallidioribus confertis subaridis utrimque acutis a stipite remotis, stipite ex albo flavido terete basin versus incrassatulo subglabro, annulo mobili subevanido candido ornato.*

Hab. In umbrosis pinguibus hortorum, La Plata, Dec. 1898.

Obs. Caespitosa, e terra erumpens. Pileus primo subglobosus ochroleucus v. flavescentis minute denseque granuloso- v. squarruloso-pulverulentus, centro magis obscurus et sordidus laevis, ambitu pallidior et laxius pulverulentus, margine stipite adpressus atque velo connatus, dein campanulato-explanatus (30-45 mm diam.) ochroleucus, non v. obtuse latissimeque umbonatus, carnosulus, rigidulus, cute dense minute subconcentrica e pulverulento squamuloso-rimulosa, margine tenui membranaceo integro non striato subinvoluto ornatus; caro ex albo flavescentis subexsueca compactiuscula mollis, in umbo (2 mm crass.) et in dimidia pilei parte centrali sat evoluta ambitu nulla sed pileo non striato nec sulcato. Lamellae sat numerosae, a stipite valde remotae, utrimque attenuato-acutatae, medio parum latae (2 mm lat.), pileo concolores v. pallidiores; areola ad apicem stiptis latissima (2 mm lat.) non marginata. Stipes erectus rectus v. flexuosulus (50 mm

long.) superne teres (4 mm crass.) pileo vix pallidior, glaber v. laxissime pulverulentus, deorsum subfusoideo-incrassatus (6-8 mm crass.) glaber v. vix pruinulosus flavescentis, apice a pileo discreto, ad tertium superum annulo tenuissime membranaceo descendente mobili facillime evanido flavescente ornatus, intus plus minusve late fistulosus cavitate fibris albo-gossypinatis farcta. Sporae albae. Odor farinaceus.

Species non marcescens sed corrugato-arescens, *L. hiathuloidi* Speg. valde affinis, sed magis carnosa et pileo non striato.

2. TRICHOLOMA ARGYROPOTAMICUS Speg., n. sp.

Diag. *Pileus carnosus hemisphaericus, dense squamuloso-flocculosus cinereus, ambitu integer albus subnudus, margine lamellas excedens, lamellis relaxatis crassis ex albo roseis sinuatis non v. vix adnatis, stipite farcto apice laevi basique subsquamuloso subincrassato albo.*

Hab. Ab terram denudatam pingue in Parque de La Plata, Mart. 1898.

Obs. Pileus hemisphaericus convexus (45-50 mm diam.) carnosus, eute sicca flocculosa cinerascente centro reticulato-diffracta, ceterum subsquamulosa, ambitu nuda alba, margine (1 mm) lamellas excente tectus; caro (10 mm crass. ad centr.) alba immutabilis compacta, sapore terreo dulci-acri, ad marginem usque producta. Lamellae (6 mm lat.) relaxatae 3-macriae rigidulo-fragiles crassiusculae, acie integerrimae, antice acutato-rotundatae, postice sinuato-adnatae; stipes (50 mm crass.), teres apice leniter incrassatus (8 mm crass.), deorsum iterum incrassatus sed ima basi attenuato-obtusatus (5 mm crass.), farctus, carnosofibrosus, intus albus, extus superne laevis subnitens, medio subannulatus, postice minute squamulosus v. fuscurellus ac fuscescens, sub parte inflata fibrilloso-striatus ac flavescentis. Sporae...

3. OMPHALIA ARECHAVALETAI Speg., n. sp.

Diag. *Umbraculifera, subsolitaria terrestris, pileo convexulo exumbonato subcoccineo glabro laevi, carne citrina, lamellis primo citrinis dein subglauciscentibus, stipite fistuloso compressulo basi attenuato e livido-aurantio subglaucacente, sporis laevibus ovatis.*

Hab. Ad terram in pratis editioribus prope Montevideo, Maj. 1898
(leg. Cl. J. J. Arechavaleta).

Obs. Solitaria v. paucigregaria. Pileus hemisphaericus (40-15 mm diam.) convexus, carnosulus, exumbonatus, centro glaber v. pulvisculo heterogeneo adspersus, margine integer, in juventute subinvolutus; caro tenuis flocculosa citrina; lamellae subangustae atque subconfertiusculae, acie integræ polymacriae, antice acutæ postice truncato-adnatae denticuloque breviter decurrentes, primo citrinae, dein nubecula ex albo violascentè velatae; stipes errectus flexuosulus, saepius compressus saepeque longitudinaliter grosse parceque sulcatus (20-25 mm long. = 2,5-5 mm crass.) basi attenuatus apice abrupte in pileo expansus, glaber laevis, inferne citrinus, medio flavus, superne aurantius et saepe glauco-pruinulosus, intus latissime fistulosus. Sporae ovatae v. ellipticae (12 μ long. = 6-7 μ diam.) nubiloso-farctae, hyalinae.

4. CLAUDOPUS ARGENTINENSIS Speg., n. sp.

Diag. *Major, hemisphaericus, viꝝ inaequilateralis subargenteus, pileo viꝝ centro carnoso, lamellis latis confertis a stipite remoto ex albo roseo-carneis, stipite farcto elongatulo albo-fibrilloso v. subreticulato.*

Hab. Ad trunco emortuo putrescente *Eucalypti globuli*, Parque de La Plata, Mart. 1898.

Obs. Pileus irregulariter orbicularis (8-9 cm diam.) et leniter inaequilateralis, horizontalis convexus, centro late obtuseque umbonatus margine incurvulus integer v. vix sinuoso-repandulus, cute tenui saepius radiatim minute fibrilloso-rimosa sordide argentea v. subcinerea, in vivo subviscosa, in sicco subsericea vestitus; caro candida immutabilis, in umbone flocculoso-compactiuscula super lamellas tenuissima vix evoluta, cum illa stipitis continua. Lamellæ segmentiformes tenuisculæ (10-12 mm lat.) membranaceæ confertiusculæ polymacriae, pro ratione latissimæ, antice attenuato-rotundatae, postice abrupte subtruncato-rotundatae a stipite remota, primo albæ, dein roseæ, postremo pallide carneæ. Stipes lateralis adscendente-incurvus teres (7-8 cm long. = 6-7 mm crass.), insititius, intus farctus albus, extus albus v. subpallescens saepius plus minusve obsoleteque fibrilloso-reticulatus v. fibrilloso-striatus. Sporae carne aepulverulen-

tae, ovatae, inaequilaterales (8 μ long. = 4 μ lat.) laeves.

5. CERIOMYCES ? STUCKERTI Speg., n. sp.

Diag. *Truncigenus, irregulariter subglobosus majusculus, totus intus extusque obscure ferrugineus, basi lignoso-fibrosus compactus radians, ambitum versus relaxatus floccosus, superficialiter pulverulentus, sporis globosis, laevibus intense aurantio-ferrugineis.*

Hab. Ad trunco dejecto putrescente prope Córdoba, Maj. 1899 (leg. T. Stuckert).

Obs. Sessilis, e suberoso lignosus repando-globosus (10-20 cm diam. = 8-12 cm crass.), contextu fibroso-radiante ad basin compacto sublignoso intense fulvo-ferrugineo, ambitu sensim relaxato substupposo; sporae pulverulentae densissime constitutae stratum crassiusculum superficialem (3-8 mm crass.) efficientes pulchre ferrugineae, globosae (10-15 μ diam.) episporio crasso laevi vestitae, intus protoplasmate dense minuteque granuloso farctae; saepe adsunt sporae alterae pyriformes (15-20 μ long. = 10-14 μ diam.) antice rotundatae, postice cuneatae atque in pedicello breviusculo attenuatae.

6. OLIGONEMA NITENS Rost. = List, A Mon. of Mycetz. f. 173.

Hab. Ad tigillum putrem et terram humosam, Parque de La Plata, Nov. 1898.

Obs. Sporae globosae (14-15 μ diam.), laxe reticulato-papillosae.

7. PUCCINIA GILLESI Speg., n. sp.

Diag. *Micropuccinia?; maculis nullis, soris sparsis erumpentiibus minutis irregularibus subpulverulentis atris, teleutosporis ellipticis modice umbonatis, episporio dense verruculoso vestitis, pedicello duplo longiores hyalino fultis.*

Hab. Ad folia viva *Salviae Gillesi* in montanis prope Córdoba, Maj. 1899 (leg. T. Stuckert).

Obs. Maculae nullae; acervuli amphigeni sparsi rarius paucigregarii sed non confluentes difformes (0,5-1,5 mm diam.) erumpenti-prominuli aterrimi subpulverulentii; teleutosporae ellipticae v. subobovatae (40-45 μ = 30 μ), medio uniseptatae non v. vix constrictae, episporio crassiusculo apice leniter umbonato et sublaevi, ceterum dense majusculeque papilloso

vestitae, subopace atro-fuligineae, pedicello hyalino crassiusculo (30-75 μ = 6-8 μ) subpersistente fultae.

8. PUCCINIA STUCKERTI Speg., n. sp.

Diag. *Micropuccinia?*; *maculis nullis; soris amphigenis hemisphaericо-lenticularibus valde prominulis subpulverulentis, solitariis v. dense gregariis confluentibusque atris; teleutosporis late ellipticis, ubique crasse aequaliterque tunicatis, medio 4-septatis non constrictis, episporio laevi, pulchre ferrugineis, pedicello ipsas aequante hyalino suffultis.*

Hab. Ad folia viva *Gomphrenae* prope Córdoba, Maj. 1899 (leg. T. Stuckert).

Obs. Maculae plane nullae; sori quandoque minuti (0,5-1 mm diam.) quandoque ob confluentiam majusculi (2-5 mm diam.) lenticulari-prominuli, amphigeni e pulverulento compactiusculi atri; teleutosporae ellipticae v. subobovatae, utrimque obtusissimae, laeves (34 μ long. = 23-26 μ diam.), episporio crassiusculo ubique aequali vestitae, medio 4-septatae sed non constrictae, loculis saepius 4-guttulatis, intense ferrugineae, pedicello mox fluxili crassiusculo (30-40 μ = 5-7 μ) hyalino fultae.

9. UROMYCES EUPHORBIAE Cke & Pk. = Sacc., Syll. fung. VII, 2, f. 556.

Hab. Sat vulgatus ad folia viva *Euphorbiae heterophyllae* et *E. Lorentzii* prope Córdoba, Mart. et Apr. 1899 (leg. T. Stuckert).

Obs. Uredosporae globosae (20-22 μ diam.) pallide ferrugineae laxe minuteque papillose, teleutosporae obovatae (18-25 μ = 18-20 μ) dense verruculosae, pedicello hyalino longiore mox fluxili fultae.

10. MELAMPSORA ARGENTINENSIS Speg., n. sp.

Diag. *Eumelampsora; maculis nullis, soris uredosporicis erumpentibus rufis pulverulentis, uredosporis globosis verruculosis teleutosporicis minimis innato-crustaceis atris, teleutosporis subcylindraceis apice crasse tunicatis fuscescentibusque laevis.*

Hab. Ad folia, petiolos caulesque vivos *Crotonis hirti* prope Córdoba, Apr. 1899 (leg. T. Struckert).

Obs. Maculae plane nullae v. partes infectae obsoletissime palescentes. Sori amphigeni, quandoque sparsi, quandoque circinantes minuti (0,25 — 0,50 mm diam.), uredosporici erumpenti-prominuli, pulverulentii e rufo aurantiaci, teleutesporici applanati subsclerotiaci innati, omnes plus minusve in eadem parte commixti. Uredosporae globosae (20-25 μ diam.), episporio tenui dense minuteque papilloso vestitae, grosse 1-guttulatae rufo-fumosae; teleutospores subcylindraceae (60-80 μ long. = 10-15 μ crass.) saepius geminatim e cellula prolifera basali oriundae, infra medium saepe coarctatulae, laeves apice truncatae, episporio antice incrassato atque infuscato vestitae. Species *M. helioscopiae* (Prs.) Cast. peraffinis sed notis plurimis ut videtur sat distincta!

11. AECIDIUM RIBESICOLA Speg., n. p.

Diag. *Maculis epiphyllis pallescentibus indeterminatis, pseudoperidiis saepius hypophyllis densissime constipatis pulvinulum callosum efficientibus flavescentibus, aecidiosporis globosis laevibus.*

Hab. Ad folia viva *Ribis magellanicus* in montanis prope Lago Nahuel-huapi, Dec. 1897.

Obs. Foliicola rarius petioli- v. flori-cola; maculae fere nullae oppositae indeterminatae saepius pallescentes atque concavisculae; pseudoperidia minuta (0,5-0,7 mm alt. = 0,20 — 0,25 mm diam.) densissime constipata atque pulvinulum sat prominulum superne applanatum ostiolato-alveolatum, margine obtusum repando-orbiculatum (2-6 mm diam.) efficientia, pallide flavescentia; tunica pseudoperidii tenui alba e cellulis hexagonis (25-30 μ diam.) crasse tunicatis, dense minuteque verruculosis efformata; aecidiosporae globosae (22-25 μ diam.) episporio laevissimo tenui hyalino tectae, intus nubilosofarcatae aurantiacae.

12. UREDO BOOPIDICOLA Speg., n. sp.

Diag. *Maculis fere nullis, soris parvulis sparsis subhemisphaericis atro-ferrugineis, uredosporis subglobosis laevibus majusculis.*

Hab. Ad folia viva *Boopidis squarrosoe* prope Chonkenk-aik, secus Rio Chico, Feb. 1898 (leg. C. Ameghino).

Obs. Foliicola, rarius caulicola; maculae quandoque nullae,

quandoque pallescenti-flavescentes indeterminatae; sori erumpentes hemisphaerici (0,5-4 mm diam.) subcompactiusculi, e ferrugineo atri; uredosporae subglobosae, e mutua pressione obtuse irregulariterque angulosae (25-30 μ long. = 20-30 μ diam.) laeves, tenuiter tunicatae, nubiloso farctae, ferrugininae.

13. UREDO ? PRUNI Cast. = Speg., Fung. Arg. n. v. crit., n. 438.

Hab. Ad folia languentia *Persicae vulgaris* prope Córdoba, Maj. 1899 (leg. T. Stuckert).

Obs. Species vulgatissima, cuius status teleutosporicus adhuc ignotus est, autumnali tempore per totam Rempublicam, sed in speciminibus cordubensisibus adsunt sporae dimorphae; sporae alterae (teleutosporae v. mesosporae ?) obovatae, in parte antica v. supera crasse acuteque umbonatae laeves obscureque fuligineae, ceterum laxe majusculeque papillosae pallidiores, 4-guttulatae (30-40 μ long. = 16-20 μ diam.) pedicello hyalino brevi (10-20 μ = 5-7 μ) mox fluxili fultae; alterae (uredosporae verae !) globosae (18-20 μ diam.) dense grosseque papillae, tenuiter tunicatae, uniguttulatae pallide fulvae.

14. XYLOPODIUM BONACINAI Speg., n. p.

Diag. *Majusculum album, primo clavatum clausum, dein sursum exoperidio calypratim denudatum, endoperidio irregulariter laciniato-fisso revolutoque infundibulari dehiscens, gleba pulvurulenta isabellina, floccis nullis, sporis globosis chlorinis laevibus.*

Hab. In aridis sabulosis et saxosis secus Rio Colorado prope Fortin Mercedes post pluvias, Majo 1898 (leg. et misit Prael. Presb. P. Bonacina).

Obs. Fungus pulcherrimus, solitarius v. hinc inde 2-3-gregarius, subito abunde exsurgens atque sat perdurans, magnitudine nonnihil ludens (8-20 cm alt.). Nodus mycelialis basalis terra infossus e globoso obovatus (2-3 cm long. = 2-2,5 cm diam.) compactiusculus extus subspongiosus granulis arenae implexus; peridium primitus obovatum clausum (3-10 cm long. = 2,5-6 cm diam.) album, laeve v. grosse laxe subconcentrice retrorseque squamoso-rimosum, apice obtuse rotundatum atque in stipite ejusdem longitudinem subaequante (3-8 cm long. = 1-2 cm diam.) terete v. compressulo concolore

longitudinaliter minute striato-sulcato, cortice squamuloso (exoperidii vestigiis) frustulatim secedente tecto, intus farcto coriaceo rigidulo attenuatum, dein exoperidio crassiusculo calypratim caduco orbatum, endoperidio mox longitudinaliter lacinatim dehiscente, laciniis 5-9 irregulariter linearibus v. lanceolatis flexilibus revolutis, infundibulariter apertum. Gleba subtabacina pulverulenta copiosissima cavum totum endoperidii implexens, sporis minutis globosis (4-5 μ diam.) laevibus chlorinis efformata, floccis omnino destituta.

Species X. *Delestrei* Dur. & Mntgn. valde affinis sed ut videtur satis riteque distincta.

15. *COELOSPHAERIA ? PUSILLIMA* Speg., n. sp.

Diag. *Superficialis, minutissima, dense gregaria, saepius oblique longiusculeque ostiolata, ascis pusillis clavatis octosporis farcta, sporis biguttulatis hyalinis.*

Hab. Ad ramos denudatos putrescentes *Erythrinae crista-galli* in uliginosis *Insulae Santiago*, prope La Plata, Apr. 1899.

Obs. Maculae nullae v. tota ligni superficies pallescens; perithecia densiuscule gregaria sed non constipata et saepius late diffusa, ligno semiinsculpta, globosa (120-150 μ diam.), ostiolo saepius elongato ipsa aequante obliquo gracili obtuso armata, carbonacea, glabra; asci numerosissimi clavulati, antice obtuse rotundati postice cuneato-attenuati breviterque pedicellati (p. sp. 15 μ = 6 μ ≡ ped. 5-10 = 1-2 μ), octospori aparaphysati; sporae botuliformes leniter curvulae, utrimque obtusae atque minute uniguttulatae (4-5 μ = 1 μ) hyalinae.

Species valde singularis a genere ostiolo elongato sat recedens; an melius *Pleurostoma*?

16. *DALDINIA CONCENTRICA* (Bolt.) Ces. & DNtrs = Speg., Fung. Puig., f. 139, n. 273.

Hab. Ad trunco dejecto putrescentem in sylvis *Pan de Azúcar*, Uruguay, Apr. 1899 (leg. J. J. Arechavaleta).

17. *NEOPECKIA ARGENTINENSIS* Speg., n. sp.

Diag. *Laxe gregaria, subsuperficialis, dense sordideque subcinerreo-villosa, ascis cylindraceis octosporis, sporis mediocribus 1-septatis non constrictis, fuligineis.*

Hab. Ad ramos dejectos putrescentes *Erythrinae crista-galli* in uliginosis *Insulae Santiago*, prope La Plata, Apr. 1899.

Obs. Matrix in superficie infuscata (an heterogenea ?); perithecia sparsa v. laxe gregaria, ovata, basi vix insculpta, apice obtusa, per aetatem saepius irregulariter lateque perforata, fusco-atra, membranacea e carnoso coriacella, contextu parum distincto fuligineo, hyphis septulatis laevibus pallide olivascentibus v. fumosis ($100\text{-}150 \mu = 5\text{-}7 \mu$) crispulis vestita; ascii cylindracei, antice obtuse rotundati, postice brevissime noduloseque pedicellati ($125\text{-}135 \mu = 7\text{-}8 \mu$), octospori, a paraphysati ?; sporae recte monostichae, cylindraceae, utrimque obtusiuscule rotundatae ($16\text{-}17 \mu = 6 \mu$) medio 4-septatae, non v. vix subconstrictae, loculis aequilongis grosse 4-guttulatis donatae, laeves, pulchre fuligineae.

18. HYPOCREA PLATENSIS Speg., n. sp.

Diag. *Pezizaeformis, sessilis, margine acuta, disco concaviusculo aurantio laevi, peritheciis immersis minutis, ostiolis non prominentibus, ascis cylindraceis octosporis, sporis bilocularibus olivaceis loculis mox secedenti-liberis.*

Hab. Ad ramos dejectos putrescentes *Erythrinae crista-galli* in uliginosis *Insulae Santiago* prope La Plata, Apr. 1899.

Obs. Stromata sparsa v. laxe gregaria, orbicularia (2-5 mm diam.), superne concaviuscula v. vix undulata, epunctata, aurantia, margine acuta integra, inferne convexula pallida glaberrima latiuscule adnato-sessilia. Perithecia numerosissima constipata-globulosa ($90\text{-}100 \mu$ diam.) vix ostiolata, mellea nucleo olivaceo farcta; ascii cylindracei, antice obtuse rotundati, postice breviter attenuato-pedicellati ($70\text{-}90 \mu = 4\text{-}4,5 \mu$), octospori a paraphysati; sporae recte monostichae, olivaceae, biloculares, loculis mox secedentibus globosis v. subglobosis ($3,5\text{-}4 \mu$) laevis.

Species *H. pezizaeformi* Speg. simillima, sed stromatibus aurantiis sporisque olivaceis sat recedens.

19. PHYLLOSTICTA SORDIDISSIMA Speg., n. sp.

Diag. *Maculis orbicularibus determinatis, arecenti-squarrosis sordide cinerascentibus, peritheciis minutis atro-cinereis, sporulis subellipticis biguttulatis majusculis.*

Hab. Ad folia languida *Choristigmatis Stuckertiani* prope Córdoba, Apr. et Maj. 1899 (leg. T. Stuckert).

Obs. Maculae epiphyllae, eximie determinatae, sordide cinereæ, centro saepius rimosæ v. squarroso-furfuraceæ; perithecia in centro macularum parce aggregata sublenticularia (80-90 μ diam.) atro-olivacea v. cinerascentia glabra, contextu ostio-loque parum manifestis; sporulae ellipticae v. ovatae saepe medio coarctatulae continuae, utrimque obtusiusculæ atque 1-guttulatae (10-15 μ long. = 5-6 μ crass.) hyalinae laeves.

20. PHYLLOSTICTA STUCKERTI Speg., n. sp.

Diag. *Maculis minutis orbicularibus determinatis, obscure areolatis, subhyalinis, peritheciis pusillis innatis late ostiolatis, sporulis subcylindraceis majusculis multiguttulatis.*

Hab. Ab folia viva v. languida Ipomoeæ ejusdam prope Córdoba, Apr. 1899 (leg. T. Stuckert).

Obs. Maculae amphigenæ, minutæ (0,5-3 mm diam.) sparsæ determinatae, areola plus minusve lata purpurascente cinctæ; perithecia in maculis saepius centralia pauca minima (100-150 μ diam.) lenticularia, ostiolo maximo (25 μ diam.) perforata, contextu olivaceo parum distincto; sporulae cylindraceæ (14-16 μ = 3 μ) rectæ v. leniter curvulae, utrimque obtusiusculæ, grosse multiguttulatae, hyalinae. A *Phyllostictis* ceteris in Convolvulaceis vigentibus longissime abhorrens.

21. PYRENOCHAETA THALINI Speg., n. sp.

Diag. *Maculis amphigenis arescentibus, peritheciis innato-erumpentibus minutissimis, setuloso-ostiolatis, sporulis mediocribus subellipticis hyalinis.*

Hab. Ad folia languida *Thalini* ejusdam prope Córdoba, Apr. 1899 (leg. T. Stuckert).

Obs. Maculae orbiculares, determinatae, ambitu saepius repandulae (3-6 mm diam.) arescentes, concentrica rugosæ, per aetatem deciduae et folium perforatum relinquentes; perithecia amphigena in parenchymate macularum immersa, ostiolo papillulato epidemidem perforante atque setulas 3-8 tenues atras opacas acutiusculas simplices (75-80 μ = 3-4 μ) gerente ornata; sporulae ex elliptico naviculares utrimque acutiuscule rotundatae continuae laeves hyalinae (10 μ = 3 μ).

22. SEPTORIA HOOKERI Speg., n. sp.

Diag. *Maculis amphigenis determinatis fuligineis, peritheciis sparsis pusillimis, sporulis cylindraceis arcuatus obtusis saepius biseptatis.*

Hab. Ad folia languida *Lesagueae Hookeri* prope Córdoba, Maj. 1899 (leg. T. Stuckert).

Obs. Maculae sparsae sed in quoque folio numerosae, parvulae (1-5 mm diam.) amphigenae, repando-orbiculares determinatae, obscure sordide fuligineae, per aetatem saepe centro arescenti-cinerascentes; perithecia in maculis saepius circinantis aegre perspicua innata vix erumpentia lenticularia (90-100 μ diam.) modice ostiolata, contextu fuligineo indistincto; sporulae cylindraceae v. subclavulatae saepius curvulae, crassiusculae (40-50 μ = 4 μ), utrimque obtusiusculae, 4-3 (saepius 2)-septatae, ad septa non v. vix constrictae hyalinae, laeves.

23. SEPTORIA LYCHICOLA Speg., n. sp.

Diag. *Maculis orbicularibus determinatis subochraceis, peritheciis pusillimis amphigenis, sporulis cylindraceis flexuosis continuis v. 4-septatis.*

Hab. Ad folia languida *Lycii cestroidis* prope Córdoba, Maj. 1899 (leg. T. Stuckert).

Obs. Maculae amphigenae orbiculares (1-5 mm diam.) determinatae, areola angusta obscuriore saepius cinctae pallide ochraceae v. isabellinae; perithecia minutissima, innato-prominula, pauca in quoque macula subperipherica e globoso lenticularia (50-80 μ diam.), atro-olivacea, contextu ostioloque parum perspicuis; sporulae lineares angustae subobtusiusculae (25-30 μ long. = 1,5-2 μ crass.) hyalinae laeves, flexuosulae, continuae v. 4-septatae, ad septum non constrictae.

24. SEPTORIA STUCKERTIANA Speg., n. sp.

Diag. *Maculis orbicularibus determinatis sordide fusco-cinerascentibus, peritheciis epiphyllis minimis, sporulis subclavulato-filiformibus continuis.*

Hab. Ad folia languida *Bidentis bipinnatae* in herbosis prope Córdoba, Apr. 1899 (leg. T. Struckert).

Obs. Maculae amphigenae parvulae (2-5 mm diam.) ambitu re-

pandulae v. saepe angulosae, determinatae, saepe concentrica rugosae, fuscae, centro saepe cinerascenti-pallidiores; perithecia saepius epiphylla, lenticularia (60-80 μ diam.) atra, contextu parenchymatico olivaceo donata, ostiolo minuto-perforata; sporulae rectae v. curvulae (50-55 μ = 2-3 μ) hyalinae continuae, utrimque acutiusculae. A *S. bidentis* Sacc. longissime abhorrens.

25. *CERCOSPORELLA PERONOSPOROIDES* Speg., n. sp.

Diag. *Maculis amphigenis indeterminatis subflavescentibus, caespitulis hypophyllis dense constipatis plagulas albo-cinereas angulosas efficientibus, hyphis brevibus, conidiis polymorphis.*
Hab. Ad folia languida *Jatrophae anisophyllae*, prope Córdoba, Apr. 1899 (T. Struckert).

Obs. Maculae diffusae flavescentes indeterminatae (2-5 mm diam.); caespituli, peronosporarum more, pulvinulos albo-cinereos farinosulos crassiusculos efficienes, semper hypophylli et nervationibus limitati; hyphae ellipticae v. cylindraceae, gibbosae, nodosae v. geniculatae (10-25 μ = 5-6 μ) hyalinae; conidia acro-pleuro-gena elliptica, cylindracea v. clavata (10-60 μ = 5-7 μ) continua v. 4-3-septata, ad septa non v. vix constricta, laevia, hyalina, saepius multiguttulata.

Species *C. pseudoidio* Speg. affinis, sed satis riteque distincta.

(PARS I)

55. ADESmia SALICORNIOIDES Speg., n. sp.

Diag. *Patagonium; perennis caespitosa, valde carnosa glaberrima, foliis confertis, stipularum subconnato-vaginantibus lobis ovatis, petiolo brevissimo, foliolis 3 subteretibus obovatis, floribus in ramulis acrogenis solitariis sessilibus, dentibus calycinis linearibus obtusis tubum aequantibus, corolla aurantia calyce duplo longiore, legumine 1-3-articulato nudo glabro.*

Hab. In tissuris rupium basalticarum loco *Karr-aik* vocato prope Lago Argentino, Mart. 1898 (C. A.).

Obs. Plantulae quandoque dense pulvinato-caespitosae (caespitosibus 5-10 cm diam. = 4-5 cm crass.), quandoque relaxatae subeffusae, ramis semper obscure subdichotomis (1-10 cm long. = 2-3 mm crass.), deorsum vestigiis arecentibus soridide atro-fuscescentibus foliorum annorum praeteritorum vestitis, pseudoarticulatis, sursum virescentibus atque foliiferis. Folia conferta glaberrima carnosa, postice stipulis longe connato-vaginantibus (4-5 mm long.) subturbinatis, basin versus ex albido pallidissime purpurascentibus, apice liberis, lobis adpressis ovatis subobtusiusculis viridibus ornata, petiolo brevissimo e globoso obconico (1,5 mm long. = 1 mm crass.), foliolis tribus v. rarius duobus (impare saepe deciduo v. inevoluto) obovatis v. oblanceolatis (3-5 mm long. = 2-2,5 mm crass.), deorsum cuneatis, sursum breviter cuneato-rotundatis subteretibus, ad epiphyllum leniter canaliculatis v. depresso obsolete glaucescentibus, ad hypophyllum convexis plane enerviis. Flores ad apicem ramulorum solitarii sessiles

(8 mm long.); calyx obscure viridis turbinatus (4 mm long.) lobis parum inaequalibus linearibus obtusiusculis (saepe laxe subimperspicueque puberulis) tubum aequantibus; corolla post anthesin arescens et subpersistens e rubescenti aurantiaca, vexillo suborbiculari dorso glabro v. vix obsoletissime pulverulento-pubescente, alas et carinam pallidiores leniter superante, ovario 3-4-ovulifero glabro, stylo acuto tenui longiusculo armato. Legumina 1 v. 2 articulata, articulis mox deciduis ex orbiculari triangularibus (2,5 mm lat. et alt.) valde compressis nudis glabris.

Species eximia, habitu peculiari, fere *Salicorniae* cuiusdam, mox dignoscenda.

56. *ADESMIA SUFFOCATA* Hook. f. == Speg., Plant. Pat. austr., n. 90.

Hab. Abunde in sabulosis aridissimis loco *Chonkenk-aik* vocato secus Rio Chico, Jan. 1897 (C. A.).

Obs. Legumina adhuc plane ignota nec unquam inventa !

57. *ADÉSMIA TEHUELCHA* Speg., n. sp.

Diag. *Chaetotricha*; perennis primo visu glabra sed pilis tuberculosis (glandulosis ?) plus minusve hispida, ramis herbaceis pallide virentibus effuso-adscendentibus subsimplicibus, remote foliiferis, stipulis ovatis, petiolis crassis a medio folioliferis, foliolis crassis eveniis 3-jugis spathulatis obsolete laxissimeque scabridis, floribus ad apicem ramorum laxissime racemosis, in pedunculis scabridis hamatis folio v. bractea fulcrante longioribus acrogenis aurantiacis, calyce subhispido lacinias linearibus tubo longioribus, corolla glabra calycem fere duplo superante, leguminibus pluriarticulatis longe plumoso-setuliferis.

Hab. In altiplanite altissima loco *Parr-aik* vocato secus Rio Sehuen, Apr. 1898 (C. A.).

Obs. Caudex...; rami majusculi deorsum prostrati, sursum arcuato-adscendententes crassi (20-45 cm long. = 3-5 mm crass.) succosi laete pallideque virides quandoque glaberrimi quandoque pilis simplicibus parvulis basi tuberculosis apice saepe guttula viscosa ornatis erectis adspersi non v. parce ramulosi, remote foliati; folia (10-30 mm long.) infera internodia non v. vix aequantia, supera longiora carnosula, stipulis inaequilateraliter ovatis obtusiusculis (4-5 mm long. = 3-3,5 mm lat.) saepius, margine praecipue, minute laxeque hispidulis, petiolo

crasso (2-20 mm long.) dorso convexo, ventri applanatulo non marginato, in juventute minute adpresque puberulo, per aetatem sparse hispidulo, in senectute saepius glabrato, vix infra medium foliolifero; foliolis imparipinnatis (1-7) inferis 3-jugis superis saepe ad unicum terminale reductis, obovatis (5-12 mm long. = 2-5 mm lat.), postice cuneatis antice obtusissime rotundatis (sed rarissime subretusis) crasse carnosulis enerviis margine subrevolutis, in prima juventute adpresso minute canescenti-puberulis, dein ad epiphyllum laxissime pulverulento-puberulis, ad hypophyllum glabratiss, postremo glabris vix margine obsolete remoteque scabrido-subdenticulatis. Flores (9 mm long.) in dimidia supera parte ramorum exsurgentibus; pedunculis inferis folio fulcrante stipulato 4-3 foliolato, superis bracteas ovata elliptica v. spathulata hispidula basi ornatis, elongatis (10-30 mm long.) parum patentibus rectis sed apice abrupte recurvato-hamatis, laxe patuleque hispidulis, unifloris; calyce turbinato (6 mm long.) laxe minuteque hispidulo, lobis linearibus acutis tubum leniter superantibus; corolla calyce tertio longiore, vexillo glaberrimo subaurantiaco, alas et carinam e flavescente ochroleucas vix superante. Legumina cernua 4-5 articulata, articulis ex orbiculari triangularibus (3,5 mm alt. = 3 mm lat.) setulis plumosis longis (5 mm long.) albis eleganter comatis, seminibus elliptico-ovatis, basi subtruncatulis (3 mm long. = 2 mm diam.) ex ochroleuco cinereis minute obsoleteque fusco-maculatis, glabris laevibus.

Species *A. karraikensi* Speg. valde affinis sed certe distincta, *A. Fernandezi* Ph. et *A. Torcae* Ph. non nihil accedens.

58. ADESMIA TRIJUGA Gill. = Gay, Fl. Chil. II, f. 200.

Hab. In montuosis centralibus Chubut, Nov. 1898 (n. 74-86, Koslowsky).

59. ADESMIA VILLOSA Hook. f. = Speg., Plant. Pat. austr., n. 92. —

A. Morenonis Harms in OK., Rev. gen. plant., III, 2, f. 70.

Hab. Non rara in montuosis *Pan de Azucar* vocatis prope Rio Chico, Dec. 1897 (C. A.), nec non in Valle Rio Mayo, Nov. 1898 (n. 120 Koslowsky).

Obs. Species *A. pumilae* Hook. f. longissime abhorrens nec quidem comparanda! Adest etiam varietas *acutifolia*, foliolis

adpresso longeque sericeis subargenteis foliolis lanceolatis acutis, sed nullo modo a typo separanda.

60. *VICIA BIJUGA* Gill. = Gay, Fl. Chil. II, f. 128.

Hab. Rarius in pratis editioribus prope *Chonkenk-aik* secus Rio Chico Jan. 1897 (C. A.).

Obs. Species *V. Saffordi* Ph. et *V. sericellae* Speg. valde affinis sed ut videtur satis distincta. Stipulae nectario destitutae; pedunculi puberuli prope basin articulati (2-3 mm long.); calyx turbinatus adpresso puberulus (3 mm long.) dentibus subaequalibus late triangularibus acutiusculis (1 mm long.) donatus; corolla ochroleuca (6-7 mm long.) glabra vexillo suborbiculari alas carina aequilongas nonnihil superante donata; ovarium lineare, viride, glabrum 6-ovulatum.

61. *VICIA BIJUGA* Gill. var. *longipes* Speg.

Hab. In pratis herbosis loco *Salinas* dicto secus Rio Santa Cruz, Jan. 1882 (C. S.) et prope *Sehuen-aik* secus Rio Sehuen Febr. 1898 (C. A.).

Obs. A typo recedit foliis inferis obovatis obtusis mucronatis, superis linearibus acutis, pedunculis ante anthesin petiolo brevioribus v. aequilongis, post anthesin duplo et ultra longioribus.

62. *VICIA GRAMINEA* Sims. = Franchet, Miss. d. Cap. Horn., Phan. f. 331.

Hab. Non rara in dumetis ad ripas fluminis Rio Negro, Jan. et Febr. 1898 (C. S.).

63. *VICIA PATAGONICA* Hook. f. = Speg., Pl. Pat. austr. n. 99.

Hab. In herbosis *Chonkenk-aik* secus Rio Chico, Jan. 1897 et prope *Sehuen-aik* secus Rio Sehuen, Febr. 1898 (C. A.).

64. *VICIA PATAGONICA* Hook. f. var. *depauperata* (Clos). = Speg., Prim. Fl. Chub., n. 45.

Hab. In herbosis prope Isla Pavon, Febr. 1882 (C. S.) et secus Rio Deseado Jan. 1894, nec non prope *Chonkenk-aik* secus Rio Chico, Febr. 1898 (C. A.).

Obs. Pedunculi glabri v. pubescentes 2-4-flori; pedicelli pubescentes calyce subbreviores; flores (10-12 mm long.) erecti v.

patuli, calyce plus minusve adpresso laxeque puberulo-vire-scente v. coerulescente (3 mm long.) dentibus parum inaequalibus triangularibus acutiusculis, corolla glabra triplo longiore, vexillo obovato (9-9,5 mm long.) plus minusve late intenseque coeruleo, alas ex ochroleuco coerulescentes (8-8,5 mm long.) carina apice intense atro-coerulea (6,5 mm long.) longiores superante. Legumen lineare (16-30 mm long. = 4-5 mm lat.) glabrum 10-12 spermum — Huc ducenda tiam *V. Morenonis* Harms.

65. *VICIA MAGELLANICA* Hook. f. = Speg., Pl. Pat. austr., n. 98.

Hab. Non rara in pratis fertilioribus secus Rio Chico, Febr. 1898
(C. A.).

Obs. *Vicia magellanica* Hook. f., *V. Saffordi* Ph., *V. patagonica* Hook. f., *V. andicola* HBK., *V. andicola* Ph. nec non plurimae aliae limites inter se non habent, sed semper pedunculis pedicellis calyceque plus minusve pubescentibus donatae, idcirco formas v. varietates unius speciei, *V. setifoliae* HBK. tantum sistunt, sed a *V. graminea* Sims omnino glabrata longe abberant.

66. *VICIA NIGRICANS* H. et Arn. = Speg., Prim. flor. Chub., n. 46.

Hab. Non rara in dumetis prope Lago Nahuel-huapi, Dec. 1897
(C. S.).

Obs. Variat glabra et pubescens, foliis plus minusve magnis, foliolis ellipticis ovatis v. obovatis, stipulis integris dentatis v. laciinati, pedunculis folia non aequantibus v. duplo triplove longioribus, etc.; *V. Macraei* H. & Arn., *V. fodinarum* Ph., *V. speciosa* Ph. etc. hujus speciei varietates tantum sistunt.

67. *VICIA SERICELLA* Speg., n. sp.

Diag. *Perennis laxe canescens-sericea, caule debili prostrato apice ramoso adsurgente, foliis internodiis valde brevioribus, stipulis ovatis vix calcaratis, petiolo breviusculo, cirro simplice subbrevis, foliolis oblanceolatis, non v. calloso-mucronatis saepius 2-jugis, utrimque acutiusculis, ad hypophyllum subparallele longitudinaliter rugoso-sulcatis, floribus mediocribus in axillis superioribus sessilibus saepius geminatis, calycis pubescentis dentibus linearibus acutiusculis tubum subaequantibus, corollae glabrae*

vexillo coeruleo triplo calyce longiore alas carinamque albescentes longe superantes, ovario glabro.

Hab. In pratis vallis Lago Blanco, Nov. 1898 (n. 38-103, Koslow-sky).

Obs. Stolones longissimi albescentes (10-25 mm long. = 1 mm crass.) nudi parce ramosi, ramis hinc inde superficem soli attingentes et abrupte ramulosis; ramuli arcuato-adscendentibus (5-10 cm long. = 0,5-0,8 mm crass.) subsimplices virides tetragoni sulcati, minute patentim pilosuli, internodiis insimis (5-8 mm long.) et supremis (3-5 mm long.) brevibus, mediis valde elongatis (10-20 mm long.); folia laxe sericeo-pilosa viridi-canescens sericeo-nitentiuscula crassiuncula ad hypophyllum longitudinaliter semper et eximie rugosa, infera et suprema internodium aequantia, media duplo v. triplo breviora (10-12 mm long.), stipulis dimidiato-ovatis (4-5 mm long. = 2-2,5 mm lat.) integris apice acutis, basi rotundatis v. calcare brevi integro v. sub-2-3-denticulato acutoque ornatis nectario destitutis, petiolis brevibus (2-6 mm long.) in cirro (2-8 mm long.) mucroniformi v. elongatulo simplice plus minusve circinato productis, foliolis saepius 2-jugis (rarissime 4-3) oblanceolatis (5-9 mm long. = 1,5-2,5 mm lat.) deorsum elongato-cuneatis, sursum abbreviato-cuneatis inermibus v. mucrone albescente crasso breve armatis, oppositis v. alternis inter se remotis v. approximatis. Flores ad axillas foliorum 3-6 superiorum enascentes, fere semper geminati, sessiles v. vix pedicellati (ped. 1 mm long.), patentes mediocres (9-10 mm long.), calyce turbinato viridi adpresso sericeo piloso, dentibus triangularibus acutis, inter se subaequilongis, tubum aequantibus donato, corolla glabra fere calycem ter aequante, vexillo coeruleo suborbiculari-obcordato (9-9,5 mm long. = 6 mm lat.) alas albo-ochroleucas carina alba minute coeruleo-maculata (5 mm long.) tertio longiores (6,5 mm long.) superante, staminibus alte connatis glabris, ovario oblanceolato (4,5 mm long. = 1,5 mm lat.) glaberrimo viridi 6-ovulato, stylo brevi crassiunculoque (1,5 mm long.) abrupte sursum refracto apiceque longe albo-barbato.

Species 2 caeteris hujusdem regionis distinctissima vix *V. Solisi* Ph. nonnihil accedens.

68. *VICIA SAFFORDI* Ph. = Speg., Plant. Pat. aust., n. 100.
